3-Way 360° Solar Airport Barricade Light

► OPERATION INSTRUCTIONS

If testing indoors, when installing the battery for the first time, expose the lamp under light or direct sunlight (around 250 lux) to activate it, and it will start to work. If using outdoors, there is no need to activate it, just insert the battery.

► OPERATION MODES

Press the BLINK/STEADY/OFF button on each light to work through the following 2 light patterns:

POWER DUATION	RUN TIME
The battery will be fully charged in approximately 22 hours of sunlight	
#1 - Blink	150 hours
#2 - Steady	60 hours

► FREQUENTLY ASKED QUESTIONS (FAQs)

1. While in a dark room, the light didn't respond when I inserted the battery and pressed the switch; what should I do?

- **Answer:** This is normal. When the battery is first installed, it requires some light (around 250 lux) to activate the lamp. Artificial light or sunlight will both work.

2. Why doesn't the light turn on during the day?

- **Answer:** This is normal. The light features a built-in intelligent light sensor and stays in charging mode during the day to save power. To test it, completely cover the solar panel with a dark cloth or cardboard to simulate a nighttime environment.

3. Does the working mode have a memory function?

- **Answer:** Yes. When the light is turned off (or powered off) while running a specific flashing pattern, it will automatically restore and continue using the same pattern the next time it is restarted (powered on). No manual readjustment of the mode is required after each power cycle.

NOTE: If stored for long periods, take the light out to charge in the sun once every 3 months to prevent the battery from failing due to deep discharge.
